9 New ‘Independent’ Advisers to CDC Publicly Promoted Vaccines or Took Money From Pharma — or Both

After struggling for months to fill seats on the Centers for Disease Control and Prevention's vaccine advisory committee, the U.S. Department of Health and Human Services announced nine new appointees. All have financial ties to vaccine makers or have publicly promoted COVID-19, RSV and HPV vaccines — or both.

By **Brenda Baletti, Ph.D.**

CDC

Miss a day, miss a lot. *Subscribe to The Defender's Top News of the Day.* ***It's free.***

Nine new members named to the committee that advises the Centers for Disease Control and Prevention (CDC) on vaccine recommendations have financial ties to pharmaceutical companies or have worked with public health agencies to promote the COVID-19, RSV or HPV vaccines.

The U.S. Department of Health and Human Services (HHS) in mid-February appointed the new members to the Advisory Committee on Immunization Practices (ACIP), which shapes U.S. vaccine policy.

Commenting on the new appointments, Children's Health Defense (CHD) President Mary Holland said:

> “ACIP has long been a rubber stamp for any and all vaccines Big Pharma wants to push. But the brazenness of the HHS-Big Pharma fusion has never been so much on display.
>
> “The only silver lining in this grotesque display is that more and more people are waking up to the reality that ACIP has nothing to do with health and everything to do with profit.”

The ACIP is described as an independent, nonfederal expert body made up of professionals with clinical, scientific and public health expertise. The committee decides which vaccines should be recommended to the public, who should take them and how often — recommendations the CDC typically rubber stamps.

This external advisory committee includes a chair, an executive secretary, and 15 voting members — 14 medical experts and a lay member representing consumers.

It also includes a non-voting body that offers input composed of eight ex officio members from other federal health departments and liaison representatives from health-related professional organizations like the American Association of Pediatrics.

However, when the committee convened last week to make its spring recommendations, it was missing so many voting members that it lacked a quorum. Vacant committee spaces on the “independent” committee had to be temporarily filled by government employees — ex officio members can be sworn in as temporary voting members.

Over the last year, HHS struggled to fill eight vacancies. An additional four members will be needed when existing members' four-year terms are up at the end of June.

As seats on the committee sat unfilled, industry news sites like StatNews suggested the committee “appears to be atrophying” and Medriva said there is an “unprecedented lack of expertise in the committee.”

When HHS finally announced the new members to fill the vacancies, it also reported the new members would be filling spots at last week's meeting. However, they had not yet taken their positions at the time the meeting occurred on Feb. 28-29.

A CDC spokesperson confirmed to The Defender that nine new members have been appointed to the committee, including Dr. Helen Keipp Talbot, an infectious diseases researcher at Vanderbilt University who previously served on the committee from 2018 through 2022 and will rejoin the committee to serve as chair.

Members typically are not eligible for reappointment, but in Talbot's case, the HHS provided a waiver to that existing policy.

In addition to Talbot, four members will begin their tenure immediately upon submission of paperwork. These include Dr. Denise Jamieson, dean of the University of Iowa Carver College of Medicine; Dr. Yvonne Maldonado, a professor of pediatrics at Stanford University; Dr. Robert Schechter, a medical officer with the California Department of Public Health; and Dr. Albert Shaw, an infectious diseases professor at the Yale School of Medicine.

The other appointees will begin on July 1. They include Dr. Edwin Asturias, a pediatric infectious diseases specialist at the Colorado School of Public Health; Noel Brewer, Ph.D., a professor of health behavior at the University of North Carolina; Dr. Helen Chu, an infectious diseases specialist at the University of Washington; and Dr. George Kuchel, a professor of geriatric medicine at the University of Connecticut.

All nine appointees will serve four-year terms.

“Stringent measures and rigorous screening” are reportedly used to avoid the committee members having “real or apparent” conflicts of interest.

However, all of the new appointees except for the public member have received grant funding or consulting fees from major pharmaceutical companies, including vaccine makers like Pfizer, Moderna and Merck, or have worked for HHS or on recent HHS grants developing or testing vaccines or investigating how to improve vaccine uptake.

Many of them have been key public advocates for the COVID-19, respiratory syncytial virus (RSV) and human papillomavirus (HPV) vaccines, crafting and promoting the CDC's message in the media and in the clinic.

Several have sat, sometimes together, on other vaccine advisory committees for the World Health Organization (WHO), the state of California, and The Lancet, among others.

“The Wuhan Cover-Up”

ORDER NOW

What constitutes a conflict of interest?

The committee's policies and procedures document, updated in 2022, defines a “conflict of interest” for committee members.

According to the ACIP policies, while members are actively on the committee, neither they nor their immediate families can be employed by or hold stock in a vaccine manufacturer. They cannot receive royalties from a vaccine that is being evaluated by the committee. They cannot act as advisers, consultants or a paid litigation expert to a vaccine manufacturer, or otherwise receive money from a vaccine maker — with exceptions — while they serve on the committee.

The committee's definition of a conflict of interest doesn't prohibit members from benefiting financially from HHS grants while on the committee.

It also doesn't apply to their activities before or after their time on the committee, which is when most potential members have taken money from industry or engaged in vaccine promotion that raises questions about their impartiality.

This narrowly defined conflict of interest differs markedly from how HHS defines conflict of interest in its ethics training for HHS employees. In that training, HHS warns employers that criminal law prohibits them “from participating personally or substantially in an official capacity that would have a direct and predictable defect on your financial interests,” according to a source at the CDC who asked not to be named.

HHS also notes in its training that “appearances matter” and a conflict of interest arises if a reasonable person with knowledge of relevant facts would question someone's impartiality.

Impartiality is not a requirement for membership on the CDC advisory committee. Members are required only to declare their financial conflicts at each meeting and to recuse themselves where appropriate.

Members may be granted waivers if the committee's need for their services outweighs the conflict of interest, according to the CDC.

Below are the new appointees, with a summary of their research and their links to Pharma or public health agencies and research that could raise questions about their impartiality.

ORDER NOW

Jamieson promoted COVID vaccines for pregnant women

Dr. Denise Jamieson spent most of her career working for the CDC before becoming a faculty member at Emory University and then a dean at the University of Iowa.

Jamieson is a spokesperson for the American College of Obstetricians and Gynecologists and a member of its Practice Advisory on COVID-19 Vaccines and Pregnancy.

She publicly promoted the COVID-19 vaccine as “safe and effective” for pregnant women as early as Spring 2021 — even though in January 2021, regulatory agencies were aware from Pfizer's own data that the vaccines pose serious risks for pregnant women.

The American College of Obstetricians and Gynecologists recommended pregnant women get vaccinated despite a lack of clinical trials showing safety and even before the CDC began advising pregnant women to take the vaccine.

The association was among the many women's health organizations that had urged Pfizer and Moderna to speed up vaccine tests in pregnant women, The New York Times reported.

Last year, Freedom of Information Act requests revealed the CDC bankrolled the association to the tune of $11 million to promote COVID-19 vaccination as “safe and effective” for pregnant women.

As part of her public outreach promoting the COVID-19 vaccines, Jamieson said in public interviews that fertility concerns about the vaccines were “myths” with “no biological plausibility.”

Jamieson also said there was no evidence that the vaccines caused menstrual irregularities, despite early reports that vaccines were causing menstrual irregularities. She also began advocating vaccination for adolescent girls even before the vaccines were approved for adolescents.

Maldonado studied COVID vaccines in children for Pfizer

Stanford's Dr. Yvonne Maldonado took tens of thousands of dollars in consulting fees and nearly $4 million in research funding from Pfizer since 2016, according to OpenPaymentsData.CMS.gov, the government website that tracks industry payments to medical professionals.

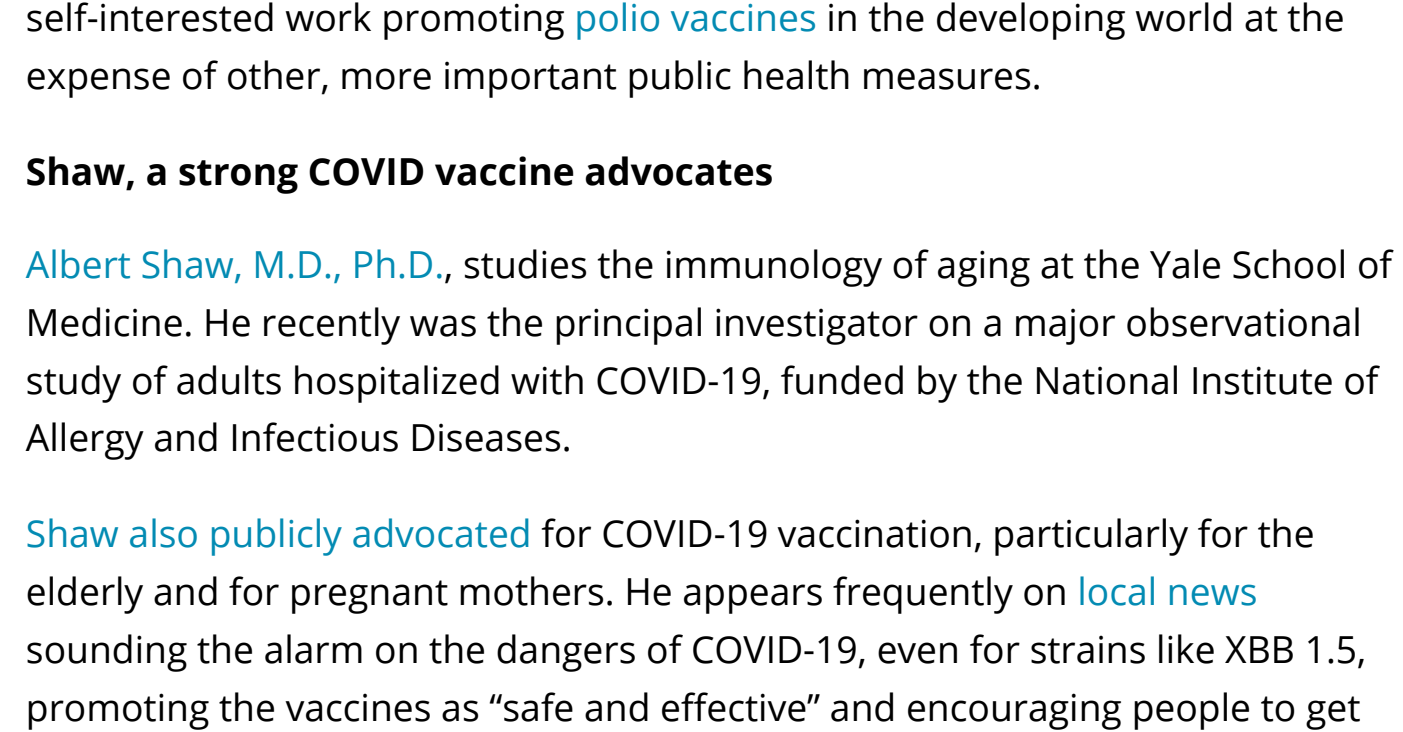
She also received consulting fees for Trumenba, a meningococcal vaccine for meningitis B.

Among the projects she has headed up are studies of nasal swab techniques that led to home testing and the development of an antibody test to detect the virus, which received U.S. Food and Drug Administration (FDA) approval.

Maldonado was a strong public advocate for testing the vaccines in children. She promoted testing the vaccines on kids in outlets like NBC News as early as October 2020, despite acknowledging children were at very low risk for serious illness.

She led clinical trials for the Pfizer-BioNTech COVID-19 vaccine in children at Stanford, promoted them as 90% effective for children and was an early advocate for including the vaccines on the childhood immunization schedule.

In this video from November 2021, Maldonado celebrates the short amount of time it took to make the vaccines and promote them for children:



Tiny Lecture: Yvonne Maldonado on the COVID-19 vaccine
COVID-19 vaccine - Get the latest information from the CDC.

Maldonado also advocated to expand the use of Paxlovid for children.

The Bill & Melinda Gates Foundation recently funded the Maldonado Group to do a 2.5-year study on the oral poliovirus vaccine in Veracruz, Mexico.

Experts have widely criticized the Gates Foundation for over a decade for its self-interested work promoting polio vaccines in the developing world at the expense of other, more important public health measures.

Shaw, a strong COVID vaccine advocate

Albert Shaw, M.D., Ph.D., studies the immunology of aging at the Yale School of Medicine. He recently was the principal investigator on a major observational study of adults hospitalized with COVID-19, funded by the National Institute of Allergy and Infectious Diseases.

Shaw also publicly advocated for COVID-19 vaccination, particularly for the elderly and for pregnant mothers. He appears frequently on local news sounding the alarm on the dangers of COVID-19, even for strains like XBB 1.5, promoting the vaccines as “safe and effective” and encouraging people to get vaccinated and boosted.

OpenPaymentsData reports that Shaw was paid $2,590.00 in consulting fees by Boehringer Ingelheim Pharmaceuticals Inc. in 2022 and $1,425.71 from GSK (formerly GlaxoSmithKline) in 2019.

Schechter, a ‘public advocate’ on multiple HHS committees

Dr. Robert Schechter appears to hold the position of the public member, meant to represent consumers on the committee. Schechter also serves as the public member of the National Vaccine Advisory Committee, another HHS vaccine advisory committee.

However, he was a medical officer with the California Department of Public Health for decades working primarily on the California Vaccines for Children Program.

He has functioned as a spokesperson, informing the public about vaccines in California, frequently quoted in local media. He also is a member of the American Association of Pediatrics.

Schechter also served on the California Department of Public Health Western States Scientific Safety Review Workgroup, along with other existing and incoming members of the CDC advisory committee Maldonado and former chair Dr. Grace Lee. That group set COVID-19 vaccine and booster recommendations.

Asturias, a global vaccine researcher with consulting fees from 5 Pharma companies

Dr. Edwin Asturias is a professor of pediatrics with a focus on Latin America. He has served on several different vaccine advisory boards globally, including in Guatemala and for the WHO.

Asturias is a member of the Strep A Vaccine Global Consortium whose mission is to make sure Strep A vaccines are available and administered. He also receives grant funding from Pfizer and is a paid consultant for Curevac, Inovio and Moderna.

Much of his research focuses on the epidemiology of disease, largely in rural Guatemala. However, over the last several years Asturias has published several articles on “vaccine hesitancy” among rural Latin American people and how to overcome it.

He has worked on several studies of community perceptions of vaccines in his native Guatemala, including studies of the attitudes among trusted leaders and parents who are key to building vaccine confidence.

According to OpenPaymentsData, Asturias received approximately $4,000 in consulting fees and over $1 million in research funding from Merck in 2022.

Since 2016, Asturias has received over $60,000 in consulting fees and travel costs from Merck, Pfizer, GSK, Sanofi Pasteur and Astellas Pharma, and almost $3 million in research funding from Pfizer, over $750,000 in research funding from GSK and a small amount of funding from Takeda Vaccines.

That is in addition to tens of thousands of dollars in payments from those same companies in 2014.

Brewer, a Merck consultant who developed the ‘Announcement Approach’ to HPV vaccination

Asturias will be joined on the committee by another Merck consultant and “vaccine hesitancy” expert, Noel Brewer, Ph.D.

Brewer is a behavioral psychologist at the University of North Carolina's Gillings School of Public Health, a paid consultant for Merck and the recipient of commercial research grants from Merck, Pfizer and GSK.

Over the past several years, Brewer received millions of dollars in funding from HHS for research on how to increase teen uptake of the HPV vaccine, documents obtained by CHD via a Freedom of Information Act request revealed.

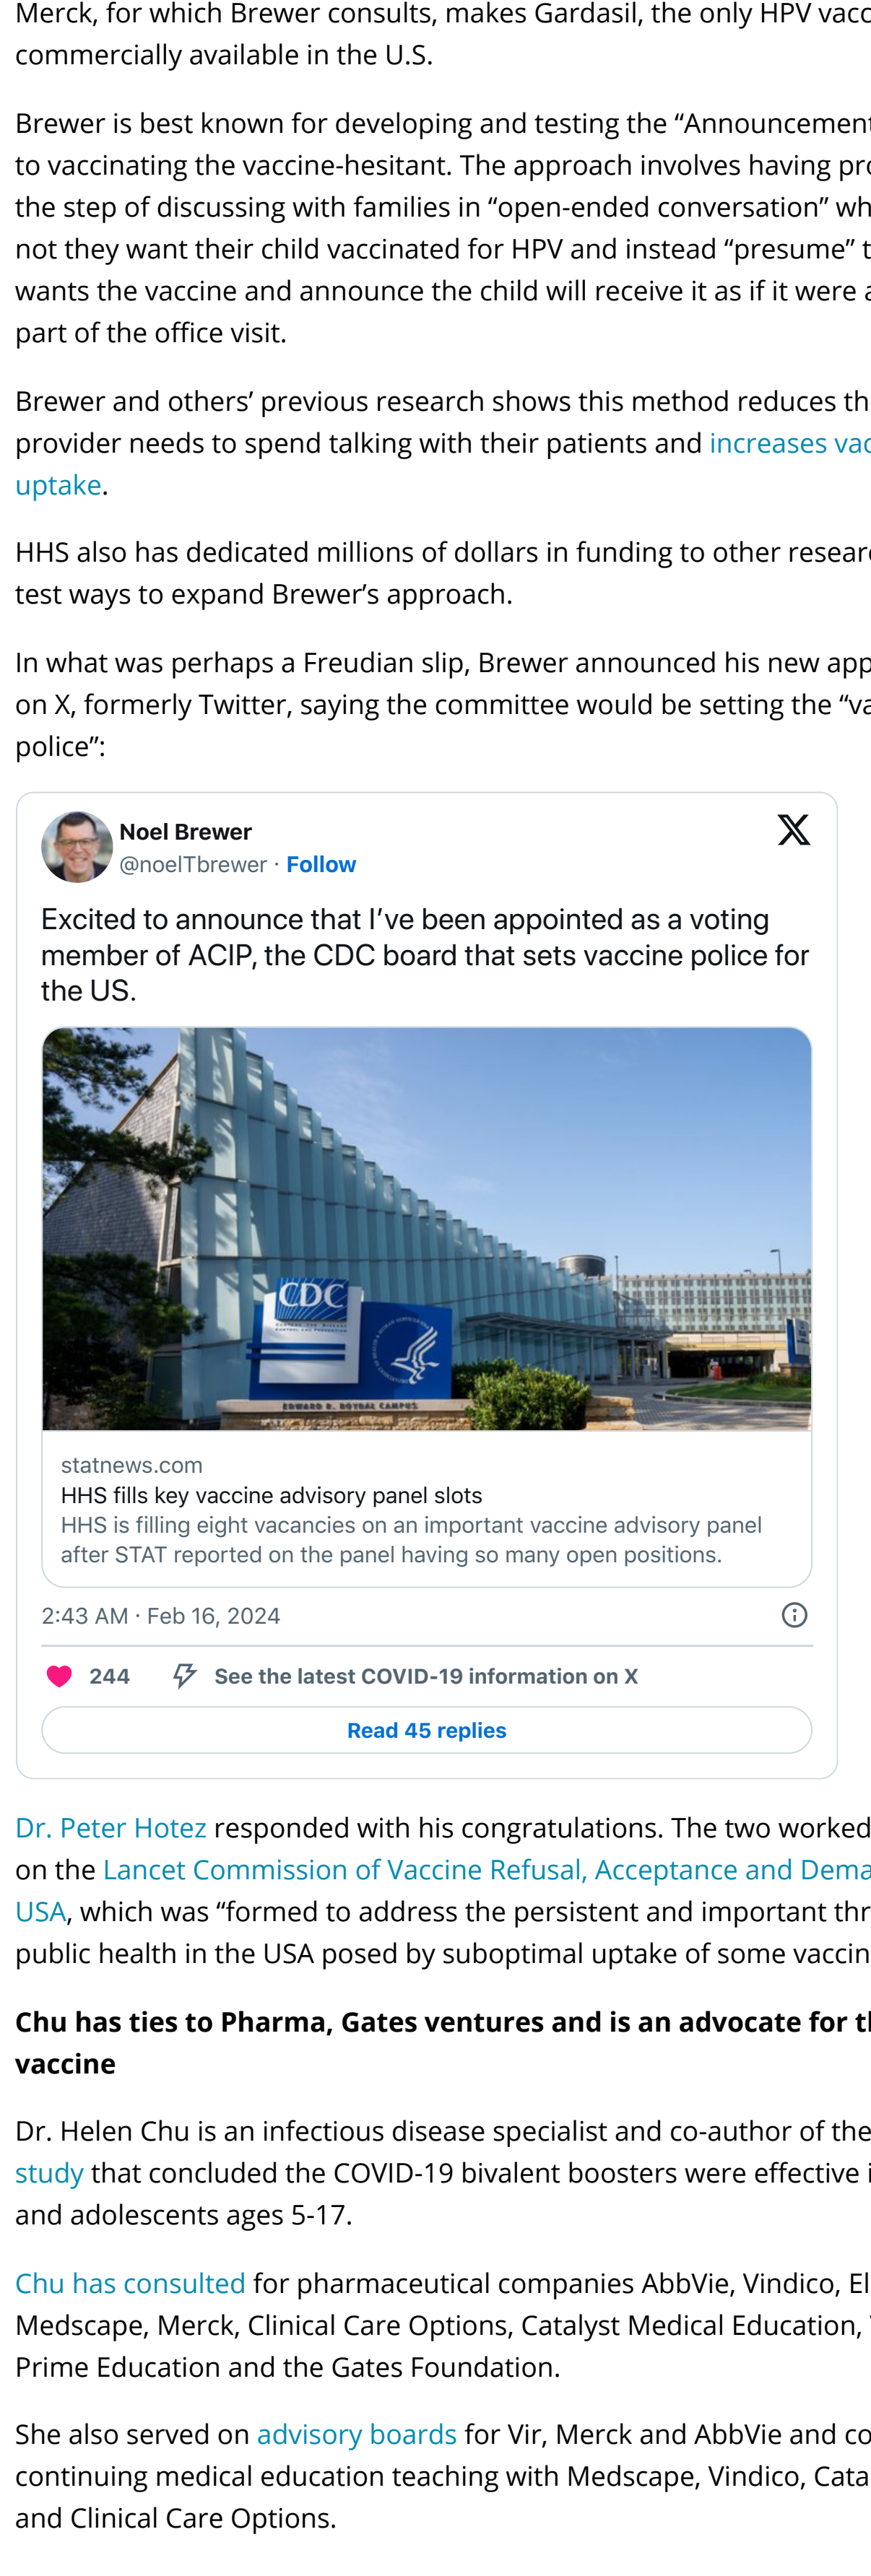
Merck, for which Brewer consults, makes Gardasil, the only HPV vaccine commercially available in the U.S.

Brewer is best known for developing and testing the “Announcement Approach” to vaccinating the vaccine-hesitant. The approach involves having providers skip the step of discussing with families in “open-ended conversation” whether or not they want their child vaccinated for HPV and instead “presume” the family wants the vaccine and announce the child will receive it as if it were a routine part of the office visit.

Brewer and others' previous research shows this method reduces the time a provider needs to spend talking with their patients and increases vaccine uptake.

HHS also has dedicated millions of dollars in funding to other researchers to test ways to expand Brewer's approach.

In what was perhaps a Freudian slip, Brewer announced his new appointment on X, formerly Twitter, saying the committee would be setting the “vaccine police”:



Noel Brewer
@noelTbrewer · Follow

Excited to announce that I've been appointed as a voting member of ACIP, the CDC board that sets vaccine police for the US.

statnews.com
HHS fills key vaccine advisory panel slots

Read 45 replies

Dr. Peter Hotez responded with his congratulations. The two worked together on the Lancet Commission of Vaccine Refusal, Acceptance and Demand in the USA, which was “formed to address the persistent and important threat to public health in the USA posed by suboptimal uptake of some vaccines.”

Chu has ties to Pharma, Gates ventures and is an advocate for the RSV vaccine

Dr. Helen Chu is an infectious disease specialist and co-author of the JAMA study that concluded the COVID-19 bivalent boosters were effective in children and adolescents ages 5-17.

Chu has consulted for pharmaceutical companies AbbVie, Vindico, Ellume, Medscape, Merck, Clinical Care Options, Catalyst Medical Education, Vir, Pfizer, Prime Education and the Gates Foundation.

She also served on advisory boards for Vir, Merck and AbbVie and conducted continuing medical education teaching with Medscape, Vindico, Catalyst CME and Clinical Care Options.

Gates Ventures has published her research and she also obtained support from Cepheid, a PCR testing company.

As an RSV researcher, Chu early on, on X (formerly Twitter), raised the alarm about a “triple-demic” dangerous for children and the elderly.

Later, she promoted the RSV vaccine, particularly for pregnant women. She is a co-author of a systematic review in The Lancet, out this month, finding that infants, particularly pre-term babies, have a higher risk for RSV-related severe acute lower respiratory infection.

Chu and her co-authors conclude: “Preventive products for RSV can have a substantial public health impact by preventing RSV-associated … severe outcomes from infection in preterm infants,” a finding that implies vaccination during pregnancy or of infants would be appropriate, as these are the measures currently available or being considered.

GSK halted its Phase 3 clinical trial of RSV in pregnant women in 2022 after the company identified a safety signal for preterm birth. Pfizer was criticized for not informing women of the risk, the BMJ reported. Pfizer's version of the RSV vaccine received FDA approval after Chu presented her research to the FDA's vaccine advisory committee in May.

After the FDA approved it, the CDC advisory committee that Chu will sit on recommended it.

In less than a year since its approval, CDC data and the Vaccine Adverse Event Reporting System (VAERS) already show reports of 34 deaths, 302 serious adverse events and according to news reports this week, a safety signal for Guillain-Barré syndrome, The Defender reported.

As an example of her Pharma-funded educational work, in March, Chu presented a Pfizer-funded webinar to educate providers on “the burden of RSV in older adults” and the “importance of RSV awareness.”

Kuchel strongly advocates the RSV vaccine for pregnant women and the elderly

Dr. George Kuchel, professor of geriatric medicine is a strong advocate for the RSV vaccine in pregnant women and older people. He promoted the vaccine as potentially “transformational” for older people — just like the COVID-19 and flu vaccines, he said.

In 2023, Kuchel told the media there was no evidence the vaccine posed a risk to pregnant women, despite the safety signals in GSK's trials.

Kuchel is currently working on a five-year, $9 million grant from the National Institute of Allergy and Infectious Diseases to study flu vaccines in older adults.

According to OpenPaymentsData, he has taken consulting fees — approximately $13,000 from Janssen Global Service in 2019 and approximately $1,300 from Novo Nordisk in 2020.

Former member Talbot replaces Lee as chair

The final new appointee, former committee member Dr. Helen Keipp Talbot, will rejoin the committee as chair. Her research focuses on adult vaccination, influenza vaccination, human coronaviruses and vaccine trials for respiratory illnesses such as RSV.

According to Talbot's curriculum vitae — last updated in 2018 before she joined the committee — her most recent research funding comes from both the federal government (CDC, National Institutes of Health) and Sanofi Pasteur, primarily for the study of pandemic preparedness in 2015 and influenza vaccination.

Sanofi and MedImmune have been recurrent funders since 2009, along with AstraZeneca, Gilead, Protein Sciences, VaxInnate and Wyeth (since acquired by Pfizer).

According to the OpenPaymentsData, Talbot received roughly $1.4 million in research payments and associated research funding since 2014 (417 total payments) from these companies, along with 29 general payments totaling $17,000, The Defender reported.

Talbot sat on the committee through the pandemic that voted to recommend the COVID-19 vaccines and boosters for adults and children.

Talbot will replace former chair, Dr. Grace Lee, who was associate chief medical officer for practice innovation at Stanford Medicine Children's Health and a pediatrics professor at Stanford School of Medicine since 2017.

While committee appointments are typically four years long, Lee served only two, and the chair position currently sits vacant. Her office did not respond to The Defender's inquiry as to why she resigned from the committee.

While she was on the committee, her husband, Joshua Salomon, Ph.D., health policy professor at Stanford was heading up a major, multi-million dollar five-year CDC-funded project to model local and national policies for responding to infectious diseases. That work is also funded by the Gates Foundation.

Here is an idea. How about we get our own committee to determine what vaccines are appropriate for mankind. On the committee we can select people such as Dr. Josef Mercola, Sherri Tenpenny, Pierre Kory, Susan Humphries, and others that we know are looking out for mankind and not industry that is destroying the health of humanity. We know that these people do not have any financial incentive to approve products that destroy health.

Yes, put our tax dollars toward independent scientists and doctors, that cannot participate if they are getting grants or payoffs from pharma. Nothing short of that will ensure safety.

I think it was Dr.McCullough who said that it can even take a few years for the shot to cause sudden death and then the doctors don't connect it to the shot. Even when people drop dead an hour after they get the shot doctors still deny it was the shot. I read they were warned that they would lose their medical license if they admitted the covid shots were harmful. This is SO criminal !! I will never trust doctors again!!

"Jamieson also said there was no evidence that the vaccines caused menstrual irregularities, despite early reports that vaccines were causing menstrual irregularities."

Reminds me of Baghdad Bob making claims while U.S. military vehicles passed behind him on the street in Baghdad, proving him wrong.

It's all Gaslighting by the public health agencies and their cronies, anymore. The only reason they get away with it is because much of the public is still trusting of the person in the white coat or the agency head, as they lie on camera to their audience. When i first saw Fauci on TV, i felt no reason to distrust him. Later, i learned about his connection to AZT. The mainstream media never focused on that, keeping the public in the dark. People had to go out of their way to learn the truth.

"Asturias will be joined on the committee by another Merck consultant and "vaccine hesitancy" expert, Noel Brewer, Ph.D. Brewer is a behavioral psychologist..."

It's all about marketing the product. The sales pitch. Behavioral psychology gaming in order to trick the person into buying the product. Apparently, in New Mexico, hair dressers were to be trained on how to nudge their clients into taking the Covid shot. The trusted influencer game. One of the newer psychological games is to falsely blame the Covid virus for most of the Myocarditis problems.

The people involved with these injury and death-creating injections have to be living down in some dark pit and are so isolated that they are unaware of how many people have awakened...and want to hold these mfgrs of plague responsible. No more turning the other cheek. They must pay financially and let the punishment fit the crime for all the suffering they have created with their less than scientific pursuits. They think so highly of their money-producing products..let.all connected with their promotion be injected many times over with these shots...to really pay for what they have done to innocent children and others.

I feel so much better knowing that big government is employing the greatest scientific minds to advocate for the latest experimental vaccines and drugs mankind can invent. All waiting to be tested and trialed on the population at large.
How many of these scientists bought into the hype that opiods aren't addictive nor harmful, before medical science declared that theory wrong? Or is the word "admitted"?
Or that Phen-fen was a good drug cocktail for losing weight, before discovering that it created heart problems.
I am confident that between all of the TV ads for Ozempic, Gardasil, etc, the nightly news shows will be dutifully informing the public of all of the conflicts of interests these board members have, how they have no ethical or legal standards expected of them, and how they all come from different political parties and skeptical religious backgrounds that do not take government proclamations at face value.
Do they really think people aren't aware of what is being done to them?
